This continuing medical education service is brought to you by MIMS. Read the article ‘Hysteroscopic Surgery in Gynaecological Practice’ and answer the following questions. This MIMS JPOG article has been accredited for CME by the Hong Kong College of Obstetricians and Gynaecologists.

**CME ARTICLE **

**Hysteroscopic Surgery in Gynaecological Practice**

Answer True or False to the questions below.

1. Compared with diagnostic hysteroscopy, ultrasound has a higher sensitivity and specificity in the diagnosis of endometrial polyps and submucosal fibroids.  
   - True  
   - False

2. Operative time using HTRs are quicker than conventional resectoscope in treating submucosal fibroids.  
   - True  
   - False

3. Endometrial polyp resection using blind technique (such as polyp forceps) has a high complete resection rate.  
   - True  
   - False

4. Second-generation endometrial ablation is as effective as first-generation endometrial ablation in the management of menorrhagia.  
   - True  
   - False

5. For a premenopausal woman who’s not planning further pregnancies, contraception is not needed following an endometrial ablation procedure.  
   - True  
   - False

6. Severe complications of hysteroscopic procedure occurs in more than 1% of procedures.  
   - True  
   - False

7. CO₂ as distension media should be used for diagnostic hysteroscopy only.  
   - True  
   - False

8. Isotonic distension media is more likely to cause hyponatraemia than hypotonic solutions.  
   - True  
   - False

9. GnRH analogue given to premenopausal women reduced the incidence of fluid overload during operative hysteroscopic surgery.  
   - True  
   - False

10. BSGE/ESGE recommended that fluid deficit should be limited to 1,000 mL when using isotonic fluid (eg, normal saline as distending medium).  
    - True  
    - False
